- Dar feedback de su utilidad

COVID-19

Enfermedad por coronavirus 2019

CÓMO PONERSE EL EQUIPO DE PROTECCIÓN PERSONAL (EPP)

- Identifique peligros y gestione riesgos. Busque el EPP necesario.
- Vea dónde se pondrá y quitará el EPP.
- Pida ayuda a un amigo o póngase delante de un espejo.
- Descarte todo el EPP en un cubo de basura adecuado.

Póngase la bata. | Póngase la mascarilla quirúrgica o respirador.* | Póngase la protección ocular (gafas protectoras) o facial (protector facial).† | Póngase los guantes (incluso sobre la muñeca).

*Puede ser una mascarilla quirúrgica o un respirador (N95 o similar), según el nivel de atención.
En el procedimiento generador de aerosoles (PGA), use un respirador (N95 o similar).
†Por ejemplo, visor, careta o gafas protectoras (considere la posibilidad de usar gafas antiempañante o un líquido antiempañante).

CÓMO QUITARSE EL EPP

- Evite la contaminación para usted mismo, los demás y el entorno.
- Quítese primero los elementos más contaminados.

Quítese los guantes y luego la bata. | Higiénicese las manos. | Quítese la protección ocular, desde atrás hacia adelante. | Quítese la mascarilla quirúrgica o respirador, desde atrás hacia adelante. | Higiénicese las manos.

Nivel de atención	Higiene de las manos	Bata	Mascarilla quirúrgica	Respirador (N95 o similar)	Gafas protectoras (protección ocular) o protección de cara (protección facial)	Guantes
Triaje	●		●			
Recogida de muestras para diagnóstico de laboratorio	●	●		●	●	●
Caso sospechoso o confirmado de COVID-19 que requiera ser admitido en el establecimiento de salud, pero no requiera ningún procedimiento generador de aerosoles	●	●	●		●	●
Caso sospechoso o confirmado de COVID-19 que requiera ser admitido en el establecimiento de salud y que requiera algún procedimiento generador de aerosoles‡	●	●		●	●	●

‡Los procedimientos que generan aerosoles comprenden la ventilación con presión positiva (sistema de bipresión positiva o sistema de presión positiva continua), intubación endotraqueal, aspiración de las vías respiratorias, ventilación oscilatoria de alta frecuencia, traqueotomía, fisioterapia torácica, tratamiento con nebulizador, inducción del esputo, broncoscopía y necropsias.

Reducing transmission of SARS-CoV-2

Kimberly A. Prather[1], Chia C. Wang,[2,3] Robert T. Schooley[4]

Masks reduce airborne transmission

Infectious aerosol particles can be released during breathing and speaking by asymptomatic infected individuals. No masking maximizes exposure, whereas universal masking results in the least exposure.

ORIGINAL CONTRIBUTION

Early Self-Proning in Awake, Non-intubated Patients in the Emergency Department: A Single ED's Experience During the COVID-19 Pandemic

Nicholas D. Caputo, MD, MSc[1], Reuben J. Strayer, MD[2], and Richard Levitan, MD[3]

ACADEMIC EMERGENCY MEDICINE 2020;27:375–378.

Methods: This pilot study was carried out in a single urban ED in New York City. We included patients suspected of having COVID-19 with hypoxia on arrival. A standard pulse oximeter was used to measure SpO_2. SpO_2 measurements were recorded at triage and after 5 minutes of proning. Supplemental oxygenation methods included non-rebreather mask (NRB) and nasal cannula. We also characterized post-proning failure rates of intubation within the first 24 hours of arrival to the ED.

Results: Fifty patients were included. Overall, the median SpO_2 at triage was 80% (IQR 69 to 85). After application of supplemental oxygen was given to patients on room air it was 84% (IQR 75 to 90). After 5 minutes of proning was added SpO_2 improved to 94% (IQR 90 to 95). Comparison of the pre- to post-median by the Wilcoxon Rank-sum test yielded P = 0.001. Thirteen patients (24%) failed to improve or maintain their oxygen saturations and required endotracheal intubation within 24 hours of arrival to the ED.

Protocolo de acción

Convalescent plasma or hyperimmune immunoglobulin for people with COVID-19: a rapid review (Review)

Valk SJ, Piechotta V, Chai KL, Doree C, Monsef I, Wood EM, Lamikanra A, Kimber C, McQuilten Z, So-Osman C, Estcourt LJ, Skoetz N

Authors' conclusions

We identified eight studies (seven case-series and one prospectively planned single-arm intervention study) with a total of 32 participants (range 1 to 10). Most studies assessed the risks of the intervention; reporting two adverse events (potentially grade 3 or 4), one of which was a serious adverse event. We are very uncertain whether convalescent plasma is effective for people admitted to hospital with COVID-19 as studies reported results inconsistently, making it difficult to compare results and to draw conclusions. We identified very low-certainty evidence on the effectiveness and safety of convalescent plasma therapy for people with COVID-19; all studies were at high risk of bias and reporting quality was low.

No RCTs or controlled non-randomised studies evaluating benefits and harms of convalescent plasma have been completed. There are 47 ongoing studies evaluating convalescent plasma, of which 22 are RCTs, and one trial evaluating hyperimmune immunoglobulin. We will update this review as a living systematic review, based on monthly searches in the above mentioned databases and registries. These updates are likely to show different results to those reported here.

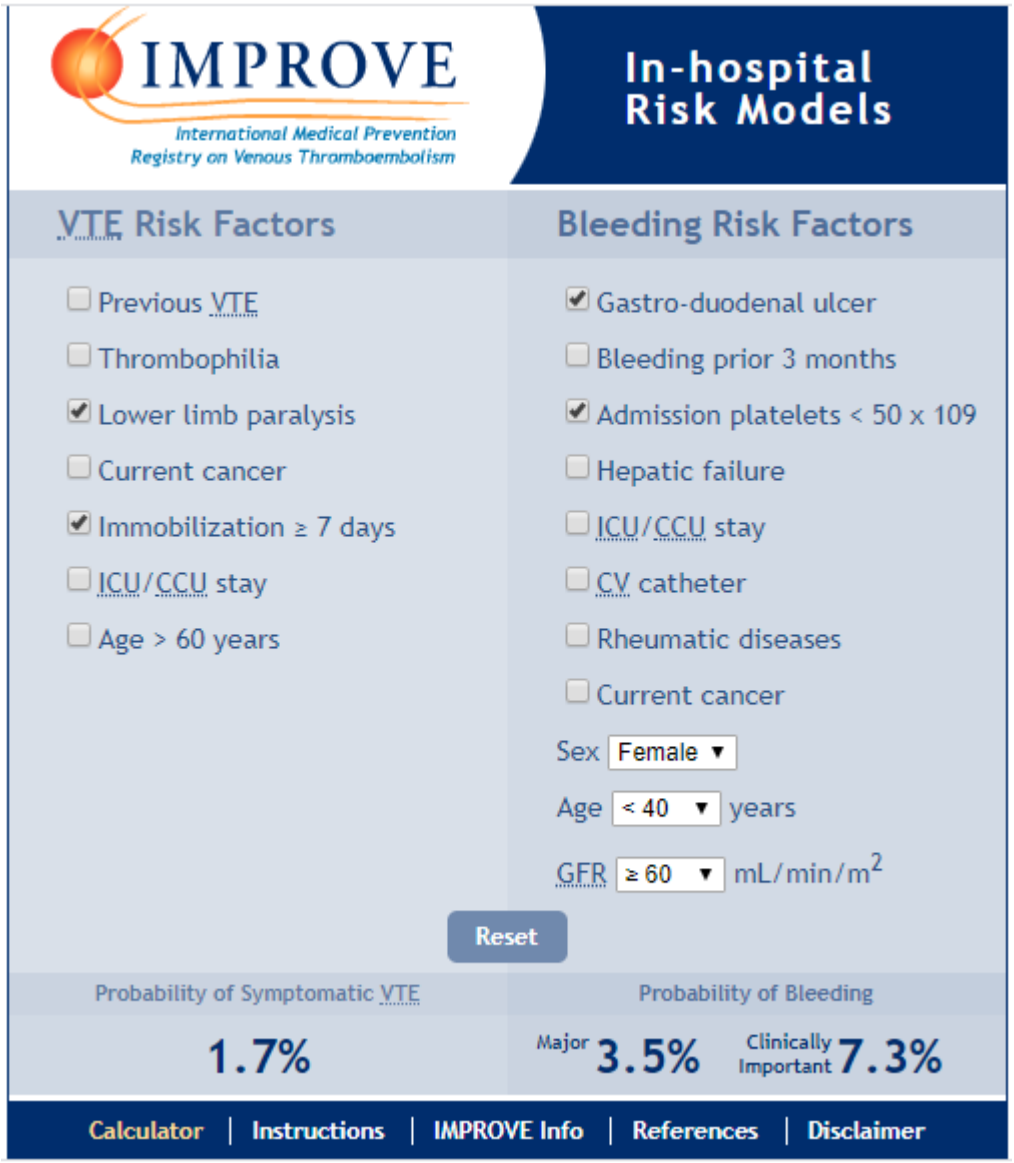
Scientific and Standardization Committee Communication: Clinical Guidance on the Diagnosis, Prevention and Treatment of Venous Thromboembolism in Hospitalized Patients With COVID-19

Guidance Statement 1: Diagnosis of VTE in hospitalized COVID-19 patients:

a. *Practitioners should use standard-of-care objective testing (i.e., CTPA, V/Q scan, MRI venography, Doppler ultrasonography) to diagnose VTE based on clinical index of suspicion. A pragmatic approach (i.e., point-of-care bedside ultrasonography or echocardiography) can also be combined with standard-of-care objective testing (50% of respondents).*
b. *Routine screening for VTE using bedside Doppler ultrasonography of the lower extremities or based on elevated D-dimer levels is not recommended.*



Padua Prediction Score for Risk of VTE

Determines anticoagulation need in hospitalized patients by risk of VTE.

When to Use | Pearls/Pitfalls | Why Use

Active cancer	No 0	Yes +3
Previous VTE Excluding superficial vein thrombosis	No 0	Yes +3
Reduced mobility	No 0	Yes +3
Already known thrombophilic condition	No 0	Yes +3

0 points

Pharmacologic prophylaxis is NOT indicated. Consider using mechanical prophylaxis.

Guidance Statement 2: VTE prophylaxis in non-ICU hospitalized COVID-19 patients:

a) *A universal strategy of routine thromboprophylaxis with standard-dose UFH or LMWH should be used after careful assessment of bleed risk, with LMWH as the preferred agent. Intermediate-dose LMWH may also be considered (30% of respondents).*

b) *VTE prophylaxis recommendations should be modified based on extremes of body weight, severe thrombocytopenia (i.e. platelet counts of 50,000 x 10^9 per liter or 25,000 x 10^9 per liter) or deteriorating renal function.*

Conclusiones

- Manejo protocolizado
- Feedback de protocolos, información va cambiando día a día
- Evaluación de mecánica ventilatoria, no guiarse solo por PaFi
- Solicitar apoyo de especialistas en caso de ser necesario

Manejo del paciente COVID19 hospitalizado en sala no intensiva
